

ABSTRACT

Apparatus, methods, and systems for provision of unified logging interfaces or services, for example, employed within application servers. In one embodiment of the invention, a unified logging API provides unified configuration and/or viewing for both tracing and logging. A unified logging system includes: one or more log controllers to represent source data, each of the log controllers receiving one or more messages; a log manager coupled to the log controllers to manage the log controllers; and one or more logs to represent one or more corresponding destinations for the received messages.
